

**ks(Kolmogorov-Smirnov):**

ks用于模型风险区分能力进行评估， 指标衡量的是好坏样本累计分部之间的差值。

好坏样本累计差异越大， ks指标越大， 那么模型的风险区分能力越强。

$$ks = \max(ks_i) = \max\left(\frac{Cum.B_i}{Bad_{total}} - \frac{Cum.G_i}{Good_{total}}\right) \quad (1)$$
