

ModelCAI

KS(Kolmogorov-Smirnov):

ks用于模型风险区分能力进行评估，指标衡量的是好坏样本累计分部之间的差值。

好坏样本累计差异越大，ks指标越大，那么模型的风险区分能力越强。

$$ks = \max(ks_i) = \max\left(\frac{Cum.B_i}{Bad_{total}} - \frac{Cum.G_i}{Good_{total}}\right) \quad (1)$$

IV值(Information Value)：

在确定模型预测目标后，对于二分类的目标变量，一般用 IV 值(Information Value)以挑选变量。

原理公式如下图：

-	Good	Bad	Good%	Bad%	---WOE---	-----IV-----
-	-	-	(1)	(2)	$\log(1/2)$	$(1 - 2) * WOE$
$Group_1$	G_1	B_1	G_1/G	B_1/B	$\log(\frac{G_1/G}{B_1/B})$	$(G_1/G - B_1/B) \times \log(\frac{G_1/G}{B_1/B})$
$Group_2$	G_2	B_2	G_2/G	B_2/B	$\log(\frac{G_2/G}{B_2/B})$	$(G_2/G - B_2/B) \times \log(\frac{G_2/G}{B_2/B})$
...						
$Group_N$	G_N	B_N	G_N/G	B_N/B	$\log(\frac{G_N/G}{B_N/B})$	$(G_N/G - B_N/B) \times \log(\frac{G_N/G}{B_N/B})$
Total	$G = \sum G_i$	$B = \sum B_i$	-	-	-	$\sum (\frac{G_i}{G} - \frac{B_i}{B}) \times \log(\frac{G_i/G}{B_i/B})$

可解释为衡量特征包含预测变量浓度的指标。

示例如下图，该变量各取值 IV 值以及总体 IV 值， $0.197 > 0.1$ ，有一定的预测性。

-	非目标数	目标数	总计	WOE	IV
A61	386	217	603	0.271	0.047
A62	69	34	103	0.140	0.002
A63	52	11	63	-0.707	0.027
A64	42	6	48	-1.099	0.044
A65	151	32	183	-0.704	0.077
Total	700	300	1000	-	0.197

一般认定

IV<0.02 即没有预测性，不可用；

0.02<=IV<0.1 即弱预测性；

0.1<=IV<0.2 即有一定的预测性；

0.2<IV 即高预测性；
